

TRAINING : MONITORING

DE-201 : SmartReport Discovery (1 day)

Software used

SmartReport client and server

Overview

SmartReport is a monitoring appliance of IP infrastructure based on an open source solution. It facilitates and improves the infrastructure operation. It based on three functional blocks: performance management, incident management and reporting of activity.

Aim

This training provides the necessary skills to take control of SmartReport for the monitoring of an Information System. Trainees will discover how to install and configure SmartReport appliance and the client software, then how to integrate equipments in SmartReport to start monitoring.

Target Audience

System and network administrators wanting to integrate tools to monitor their technical infrastructure.

Necessary Skills

Good knowledge about TCP/IP networks

Plan

DAY 1

Integration of SmartReport appliance :

- Installation
- Configuration

Discovery of client software :

- Installation
- Configuration
- Handling of the interface

Start the equipments monitoring:

- Integration in SmartReport
- Creating performance graphs according to predefined models and apply them to equipment
- Creating good functioning tests according to predefined models and apply them to a equipment

The plan above shows the initial training plan DE-201 lasting one day. The duration training and the plan can be modified according to your needs. All our trainings are conducted in-company and may be subject to funding from your OPCA.
